The processes for the preparation of the object compound (I) of the present invention are explained in detail in the following.

(1). Process 1 :

The compound (I) or salts thereof can be prepared by reacting the compound (II) or a reactive derivative at the

oxo group thereof or salts thereof with the compound (III) or salts thereof.

Suitable salts of the compound (II) may be salts with bases such as those given for the compound (I).

The reactive derivative at the oxo group of the compound (II) can be represented by the following formula (II'), which is preferably used in this reaction and can be prepared by reacting the compound (II) or salts thereof with an acylating agent.

in which R^1 , R^2 and R^3 are each as defined above, and

R^8 is acyl as exemplified for the imino-protective group and further O,O-substituted phosphono derived from, for example, organic phosphoric acid mentioned hereinbelow.

Suitable acylating agents may include conventional ones which can introduce the acyl group as mentioned above into the compound (II), and preferable acylating agents may be organic sulfonic or phosphoric acid or its reactive

derivative such as acid halide, acid anhydride, and the like, for example, arenesulfonyl halide (e.g. benzenesulfonyl chloride, p-toluenesulfonyl chloride, p-nitrobenzenesulfonyl chloride, p-bromobenzenesulfonyl chloride, etc.), arenesulfonic anhydride (e.g. benzenesulfonic anhydride, p-toluenesulfonic anhydride, p-nitrobenzenesulfonic anhydride, etc.), lower alkanesulfonyl halide which may have additional halogen (e.g. methanesulfonyl chloride, ethanesulfonyl chloride, trifluoromethanesulfonyl chloride, etc.), lower alkanesulfonic anhydride which may have halogen (e.g. methanesulfonic anhydride, ethanesulfonic anhydride, trifluoromethanesulfonic anhydride, etc.), di(lower)alkyl phosphorohaloridate (e.g. diethyl phosphorochloridate, etc.), diaryl phosphorohaloridate (e.g. diphenyl phosphorochloridate, etc.), and the like.

This acylation reaction is usually carried out in a conventional solvent which does not adversely influence the reaction such as acetone, dioxane, acetonitrile, chloroform, dichloromethane, hexamethylphosphoramide, dichloroethane, tetrahydrofuran, ethyl acetate, dimethyl sulfoxide, N,N-dimethylformamide, pyridine, etc., or a mixture thereof.

When the acylating agent is used in a free acid form or its salt form in this reaction, the reaction is preferably carried out in the presence of a conventional condensing agent such as carbodiimide compound [e.g. N,N'-diethylcarbodiimide, N,N'-diisopropylcarbodiimide, N,N'-dicyclohexylcarbodiimide, N-cyclohexyl-N'-morpholinoethylcarbodiimide, N-cyclohexyl-N'-(4-diethylaminocyclohexyl)carbodiimide, N-ethyl-N'-(3-dimethylaminopropyl)carbodiimide, etc.]; N,N'-carbonyldiimidazole, N,N'-carbonylbis(2-methylimidazole); keteneimine compound (e.g. pentamethyleneketene-N-cyclohexylimine, diphenylketene-N-cyclohexylimine, etc.); thoxyacetylene;

of the following formula (IIB), and accordingly, it is to
be understood that both of these ring systems are
substantially the same.

or without isolation for the subsequent reaction with the
compound (III) or salts thereof.

Suitable salts of the compound (III) may be the same
as those for the compound (I) and silver salt.

20 The reaction of the compound (II) or its reactive
derivative or salts thereof with the compound (III) or
salts thereof can be carried out in the presence of an
organic or inorganic base such as those given in the
explanation of the acylation reaction as stated above.

Method A

The compound (III-a) or salts thereof can be prepared by reacting the compound (IV) or a reactive derivative at the hydroxy group thereof or salts thereof with the

compound (V) or salts thereof.

Suitable salts of the compounds (III-a) and (IV) may be the same as those for the compound (I).

 The starting compound (IV) of this method is new and can be prepared by the methods described in the Preparations mentioned below.

15 Preferable example of the compound (V) may be ar(lower)alkanethiol such as mono- or di- or triphenyl(lower)alkanethiol (e.g. phenylmethanethiol, diphenylmethanethiol, triphenylmethanethiol, etc.), thio(lower)alkanoic S-acid (e.g. thioacetic S-acid, etc.) 20 or salts thereof, thioarenoic S-acid or salts thereof (e.g. thiobenzoic S-acid, etc.), and the like, in which more preferable example may be triphenyl(C₁-C₄)alkanethiol, thio(C₁-C₄)alkanoic S-acid or alkali metal salts thereof and thio(C₆-C₁₀)arenoic S-acid 25 or alkali metal salts thereof, and the most preferable one may be triphenylmethanethiol, thioacetic S-acid and potassium thioacetate.

transformed into its alkali metal salt, if necessary, by reacting with alkali metal halide (e.g. sodium iodide, potassium iodide, etc.).

5 Further, in case that the protective groups may be acyl group, it can generally be eliminated by solvolysis such as hydrolysis using an acid or base, alcoholysis using a base, and the like.

10 Suitable acid or base used in these reactions may be the same such as those given in the explanation of hydrolysis of the Process 2.

The hydrolysis is usually carried out in a conventional solvent which does not adversely influence the reaction such as water, alcohol (e.g. methanol, ethanol, etc.), pyridine, N,N-dimethylformamide, etc., or
15 a mixture thereof, and further in case that the base or acid to be used is in liquid, it can also be used as a solvent.

The alcoholysis is usually carried out in a conventional alcohol such as methanol, ethanol, and the
20 like.

The reaction temperature is not critical and the reaction is usually carried out under from cooling to warming.

25 The object compounds obtained according to the above Processes can be isolated and purified in a conventional manner, for example, extraction, precipitation, fractional crystallization, recrystallization, chromatography, and the like.

Preparation 20-1)

To a solution of 1,2,4-triazole (100 g) in methanol (200 ml) was added 28% sodium methoxide in methanol solution (278.3 ml), followed by iodomethane (205.5 g) and the solution was warmed to 40°C for 18 hours. The solution was concentrated in vacuo to remove methanol then treated with benzene (150 ml), warmed to 70°C and decanted. This was repeated with 3 x 150 ml portions of chloroform. The combined organic layer was concentrated in vacuo to ca. 100 ml and the white precipitate was removed by filtration. After evaporation of the filtrate the resulting red liquid residue was distilled at atmospheric pressure to give 1-methyl-1,2,4-triazole (71.45 g) as a colorless liquid that solidified in the refrigerator.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claim 29 is directed to a method of treatment of (diagnostic method practised on) the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest.

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
